The benzoxazinone 3 was prepared and treated with hydrazine hydrate, hydroxylamine hydrochloride, and o-phenylenediamine to give different quinazolinones 4,5 and benzimidazoles 6,7 respectively.Product 4 reacted with different aldehydes forming different Schiff's bases 9,10a.e Also it reacted with different Grignard reagents giving alcohols(11a,b) and ketones 11c,d, according to the bulkiness of the reagent. Finally, dibromo-, monobromoamino- and diamino-quinazolinones 12,13 a-d, &14 a-d were prepared upon addition of bromine to 4, followed by reacting different amines according to their molar ratios. Some benzoxazinone, and quinazolinone derivatives were tested for their antifungal and antibacterial activities and gave promising results.

Keyword: Quinazolinones, Benzoxazinones, Schiff's Base.

1. Introduction
Many studies have been focused on benzoxazin-4(3)H-one and 3H-quinazolin-4-one and their derivatives since they possess significant activities as antifungal[11,12], antibacterial, and antimitotic anticancer activity. In the present investigation, new benzoxazin-4(3)-one and 3H-quinazolin-4-one derivatives were prepared.

2. Results and Discussion
The benzoxazin-4-one 3 was prepared and treated with hydrazine hydrate affording the 3H-quinazolin-4-one following the reaction sequence depicted in Scheme 1.

Scheme 1
Previously, it was reported that the 4H-3,1-benzoazinone derivatives gave the corresponding 3-quinazolin-4-one when reacted with hydroxylamine hydrochloride. Thus, in our case when the benzoazinone was treated with hydroxylamine hydrochloride, the 3-hydroxyquinazolin-4-one derivative was obtained. In spite of correct analytical data and I.R., the structure of 5 was also proved by C\textsuperscript{13} NMR.

It has been reported that the condensation of 2-aryl(alkyl)benzoxazinone with o-phenylenediamine gave the corresponding 2-aryl-3-hetaryl-4H3,1 quinazolinones, however, in our study, by fusion of 3 with o-phenylenediamine, the heterocyclic benzoimidazole derivative 6 was formed. Furthermore, on treating 6 with hydrazine hydrate or phenyl hydrazine in n-butanol, the corresponding hydrazino or phenylhydrazino derivatives 7 \textit{a,b} were respectively obtained. (c.f. scheme 2). The structures of 3, 4, 6, & 7 were confirmed from analytical as well as spectral data.

Owing to the great importance of the Schiff’s bases as possessing antimicrobial and antibacterial activities, the authors focused their attention on preparing new Schiff’s bases bearing quinazoline moiety. Thus refluxing 4 with hydrazine hydrate in n-butanol, gave the hydrazino derivative which undergoes condensation with thiophene-2-carboxaldehyde giving the Schiff’s base. In spite of all analytical and spectral data for proving the structure of 9, an authentic reaction was done by refluxing 10e with hydrazine hydrate giving 9 in good yield. Also 4 reacted with different aldehydes namely 2-chloro-5-nitrobenzaldehyde, indole-3-carboxaldehyde, 2-chlorobenzaldehyde, and thiophene-2-carboxaldehyde (c.f. Scheme 3), to give the Schiff’s bases 10a-e.
When different Grignard reagents namely phenylmagnesium bromide, methylmagnesium iodide, benzylmagnesium bromide, and naphthylmagnesium bromide reacted with the quinazolinone 4, different products were achieved according to the reagent (c.f. Scheme 4). Thus in the case of non-bulky reagent, a 4-substituted quinazolinol derivatives 11a,b were obtained, while with a bulky reagent, ketones 11c,d were formed[6,7]. Thus, the reaction products depend on the bulkiness of the reagent which causes steric hindrance at position 4. The product’s structures (11c,d) were confirmed from IR showing new ketonic group γC=O at 1735&1750 cm.

Finally, addition of liquid bromine to 3, gave the dibromo derivative 12 which, on turn reacted with different amines namely benzylamine, 4-methyl aniline, piperidine, and morpholine in molar ratios giving the monobromoamino derivatives 13 and the diamino derivatives 14 in good yield (c.f. Scheme 5). All the structures of the previous products were inferred from their analytical data as well as spectral data.

3. Experimental

All melting points are uncorrected. IR spectra were recorded in on Pye-Unicam SP 1200 spectrophotometer using KBr wafer technique. The H$^1$-NMR spectra were determined on Varian Gemini 200 MHz, using TMS as internal standard (chemical shifts in δ-scale). EI-MS were measured on Shimadzu-GC-MS operating at 70 eV. C$^{13}$-NMR spectra were measured on JOEL 75 MHz. Elemental analysis were carried out at the Micro-analytical Center at Cairo University. TLC on silica gel plates (Merk 60,F254) was used to monitor the reaction and for testing the purity of the products.

3.1. 5-naphthylidene 2-phenyloxazol-4-one (1)

A mixture of hippuric acid (0.01 mole), naphthaldehyde (0.01 mole), sodium acetate (anhydrous) (0.03 moles) and acetic anhydride was heated on a water bath for two hrs. The reaction mixture was cooled and poured into cold water to separate (1) m.p. 166–167 °C (60% yield) which was filtered off and crystallized from ethanol. IR (γ cm$^{-1}$): 1770(C=O), 1636(C=N).
